GLMM(F) Example 6. Power and confidence limits for the univariate approach to repeated measures in a multivariate model

Authors: Sarah Kreidler

Run Date: 2012/12/05 13:18:58

1. Introduction

The following report contains validation results for the JavaStatistics library, a component of the GLIMMPSE software system. For more information about GLIMMPSE and related publications, please visit

<http://samplesizeshop.org>.

The automated validation tests shown below compare power values produced by the JavaStatistics library to published results and also to simulation. Sources for published values include POWERLIB (Johnson *et al.* 2007) and a SAS IML implementation of the methods described by Glueck and Muller (2003).

Validation results are listed in Section 3 of the report. Timing results show the calculation and simulation times for the overall experiment and the mean times per power calculation. Summary statistics show the maximum absolute deviation between the power value calculated by the JavaStatistics library and the results obtained from SAS or via simulation. The table in Section 3.3 shows the deviation values for each individual power comparison. Deviations larger than 10^{-6} from SAS power values and 0.05 for simulated power values are displayed in red.

2. Study Design

The study design for Example 6 is a factorial design with two between participant factors and one within participant factor. Participants were categorized by gender and classified into five age groups. For each participant, cerebral vessel tortuosity was measured in four regions of the brain. We calculate power for a test of the gender by region interaction. Confidence limits are computed for the power values.

The matrix inputs below show the starting point for the **B** matrix. The third column of the matrix (i.e. vessel tortuosity in the third region the brain) is modified throughout the validation experiment to progressively increase the effect of gender. Mean values for males are increased by 0.0008 at each iteration, while corresponding values for females are decremented by 0.0008. The process is restarted for each statistical test. For example, the last power calculated for a given test would use the following **B** matrix

$$\mathbf{B} = \begin{bmatrix} 2.9 & 3.2 & 3.7 & 3.2 \\ 2.9 & 3.2 & 3.7 & 3.2 \\ 2.9 & 3.2 & 3.7 & 3.2 \\ 2.9 & 3.2 & 3.7 & 3.2 \\ 2.9 & 3.2 & 3.3 & 3.2 \\ 2.9 & 3.2 & 3.3 & 3.2 \\ 2.9 & 3.2 & 3.3 & 3.2 \\ 2.9 & 3.2 & 3.3 & 3.2 \\ 2.9 & 3.2 & 3.3 & 3.2 \end{bmatrix}$$

The design is based on an example presented in Gurka, M. J., Coffey, C. S., & Muller, K. E. (2007). Internal pilots for a class of linear mixed models with Gaussian and compound symmetric data. *Statistics in Medicine*, 26(22), 4083-4099.
